

Wang Minsheng

Operations Engineer | Virtualization Operations | Cloud Platform Engineer

Phone: +86 147-8257-0230 | Email: yelang007sheng@163.com | Chizhou, Anhui | Oct 1984

Career Objective

Target Position: Operations Engineer / Virtualization Operations Engineer / Cloud Platform Engineer

Location: Shanghai

Expected Salary: Negotiable

Availability: Within one week

Professional Skills

GPU Virtualization: Expert in GPU virtualization technologies, experienced with Hyper-V GPU sharing and passthrough (DDA). Proven track record in operating GPU-enabled cloud desktop platforms supporting 3D design applications such as Revit, SolidWorks, and CAD with GPU acceleration.

Private Cloud Operations: 8+ years of experience in VDI (Virtual Desktop Infrastructure) operations. Expert in 3DCloud design cloud platform deployment and maintenance. Proficient with Hyper-V, KVM and other hypervisors. Capable of end-to-end project delivery from solution design, server deployment, network configuration to production operations. Successfully delivered over 50 private cloud projects for large and medium-sized enterprises.

Container Technology: Skilled in Docker container deployment and operations. Experienced with Docker Compose orchestration, image building, container networking and storage configuration. Basic understanding of Kubernetes concepts with strong learning agility.

Automation Tool Development: Advanced proficiency in PowerShell and Bash scripting. Familiar with Python fundamentals. Independently developed 20+ operational tools including Hyper-V VM creation, GPU partition management, certificate management, and performance monitoring. Skilled in leveraging AI to develop Electron+React+TypeScript desktop tools, building an automated operations toolchain that improved efficiency by 60%.

ISO Automation: Expert in creating automated installation images for Ubuntu and Windows. Experienced with cloud-init, autoinstall, and unattend.xml unattended configurations supporting both BIOS and UEFI modes. Capable of customizing offline installation ISOs with pre-installed drivers and software.

Operating Systems: Expert in Windows Server and Linux (Ubuntu/CentOS) operating systems. Skilled in system deployment, performance optimization, log analysis, and troubleshooting.

Monitoring & Troubleshooting: Familiar with Prometheus+Grafana monitoring system, involved in platform monitoring configuration and alert rule definition. Possesses comprehensive troubleshooting methodology with full-stack capability from OS level to application layer.

Network & Storage: Familiar with TCP/IP protocols. Expert in AD domain, DNS, DHCP, VPN, and firewall configuration. Experienced with NAS storage (Synology, Longsun) and distributed storage deployment and maintenance. Strong network troubleshooting abilities.

Database & Middleware: Familiar with MySQL and Redis database deployment and operations. Basic knowledge of Nginx, RabbitMQ, ETCD middleware configuration. Capable of basic performance optimization and troubleshooting.

Work Experience

Shanghai Zongji Information Technology Co., Ltd.

May 2018 - Present

DevOps Engineer

- Responsible for product testing, operations, and pre/post-sales technical support for 3D design cloud platform, supporting designers in 3D modeling and rendering tasks.
- Managed Docker containerized deployment and operations for platform management, including container management, image building, networking and storage configuration to ensure stable service operations.
- Configured and optimized GPU virtualization including GPU partitioning (DDA/Passthrough), driver deployment, and performance monitoring.
- Delivered private cloud projects for over 50 design institute and manufacturing clients, covering server selection, GPU configuration, network planning, storage deployment, and platform installation.
- Established server hardware monitoring system using IPMI and system performance tools to proactively detect and resolve hardware issues.
- Developed GPU operations management tools: GPU partition management, VM quick creation (PowerShell), environment detection tool (Electron+TS), improving operational efficiency by 60%.
- Established operational standards and emergency response plans, documented operation manuals and troubleshooting guides. Achieved 1-hour response time for client issues and 4-hour recovery for critical failures.
- Created customized Ubuntu/Windows automated installation ISOs with pre-installed GPU drivers and software, reducing manual intervention in bulk server deployment.

Tianting Cloud Computing Technology Co., Ltd.

Aug 2012 - Feb 2018

Senior Competitive Analysis Engineer

- Conducted competitive research and analysis on desktop virtualization products, thoroughly studying technical architectures and market strategies of VMware, Citrix, Huawei Cloud, Sangfor, Star-Net, and Aoyun.
- Analyzed competitor features, performance metrics, deployment schemes, and customer cases, producing detailed competitive analysis reports to support product planning and technology selection decisions.

- Participated in product requirement reviews and technical solution discussions, providing competitive benchmarking recommendations to drive differentiated competitive advantages.
- Validated new product feature feasibility, assisted testing team with functional and performance testing to ensure product quality.
- Tracked cloud computing and desktop virtualization technology trends, monitoring industry developments and technological innovations to inform company technology strategy.

Shanghai Quanta Computer Inc. (Quanta Group)

Nov 2010 - May 2012

Automation Test Engineer

- Conducted factory testing for Cisco, Quanta, and Facebook servers, covering BIOS, BMC FW, network adapters, RAID controllers, CPU, memory, and hard disk hardware functionality testing.
- Developed Shell automation test scripts, achieving full-process automated hardware testing. Reduced single server testing time by 40%, significantly improving production line efficiency.
- Developed test plans and test cases, identified and analyzed hardware bugs, reported to R&D team and tracked issue resolution to ensure product quality.
- Handled production line hardware exceptions, assisted PE engineers in resolving technical issues, optimized testing processes to improve product yield.

Self-Employed (Yulin)

Oct 2009 - Oct 2010

Technical Partner

- Operated computer and office equipment sales and repair business, responsible for hardware troubleshooting, system installation, and LAN setup.
- Developed solid hardware foundation and independent problem-solving skills, fostered strong customer communication and service orientation.

Ordos Boyang Computer Co., Ltd.

Aug 2008 - Aug 2009

Technical Support Engineer

- Responsible for installation, configuration and repair of computers, printers, copiers and other office equipment.
- Provided network maintenance and technical support services for enterprise clients, resolving various software and hardware issues.

Project Experience

Project 1: Design Institute Private Cloud Platform Operations & Implementation

Role: Operations Lead

Project Description: Responsible for deployment, implementation and operations support of 3DCloud design cloud platform for over 50 design institutes and manufacturing clients nationwide, including China Electronics Engineering Institute, Dongfeng Engineering Institute, China Water Resources Northeast Institute, Jiangsu Electric Power Design Institute, Gansu Electric Power Design Institute, Beijing General Research Institute of Mining and Metallurgy, China Wuzhou Engineering Group, Three-Dimensional Chemical Engineering, Huayu SANDIAN, and China

Electronics Qimingxing. The platform is based on GPU virtualization technology, providing high-performance cloud desktops for designers to support enterprise digital transformation and remote work.

Key Responsibilities:

- End-to-end private cloud project delivery: requirements gathering, solution design, server selection, network planning, AD domain setup, storage configuration, platform deployment, and user training.
- Resource pool operations: GPU virtualization sharing, passthrough configuration, driver deployment, performance monitoring, and troubleshooting.
- Automated deployment: customized Ubuntu/Windows installation ISOs with pre-installed GPU drivers and design software for rapid bulk server deployment.
- Monitoring and alerting: established server performance monitoring, GPU utilization monitoring, system resource monitoring with alert thresholds for proactive anomaly detection.
- Troubleshooting process: established comprehensive troubleshooting procedures, performing layered analysis from hardware, system, to application layers for rapid business recovery.

Project 2: Automation Operations Tool Development Role: Independent Developer

Project Description: Built an automated operations toolchain to improve operational efficiency and service quality, covering VM management, environment detection, certificate management, performance monitoring, and ISO building. Achieved standardization, automation, and intelligence in operations workflow.

Key Responsibilities:

- Developed 20+ PowerShell operations tools: Hyper-V VM creation, GPU partition management, RD gateway certificate management, network share management, SMB performance monitoring, disk optimization, ARP binding management, all packaged as executable files.
- Leveraged AI to develop Electron+React+TypeScript desktop tools: environment detection tool for comprehensive system, software, network, and storage testing with report generation; cloud office client for RDP session management, platform connection, and policy distribution.
- ISO automation tool: unattended Ubuntu/Windows installation image customization with pre-installed drivers, software, and system configuration, enabling zero-manual-intervention bulk deployment.
- Tools deployed across 50+ projects, significantly improving operational efficiency and reducing on-site troubleshooting time by over 50%.

Project 3: Server Factory Automation Testing Role: Test Engineer

Project Description: Pre-shipment functional and performance testing for Cisco, Quanta and other server series, covering BIOS, BMC, network adapters, RAID, CPU, memory, hard disks and other hardware components. Automated testing implemented via PXE network boot and Shell scripting.

Key Responsibilities:

- Developed test plans, designed test cases and automation test scripts.

- Created Shell automation test scripts for BIOS version, BMC FW, network adapters, RAID controllers and other hardware components.
- Hardware fault localization: identified and validated hardware bugs and test tool bugs, reported to R&D team and tracked resolution.
- Production line support: assisted with production line issue resolution, optimized testing processes to improve efficiency and product yield.

Education

Luoyang Normal University

Sep 2004 - Jun 2008

Bachelor of Science in Information and Computing Science

Self-Assessment

- 16 years of IT experience spanning hardware testing to cloud operations, with solid technical foundation and full-stack troubleshooting capability from hardware to application layers.
- 8+ years of private cloud platform operations experience, with end-to-end project delivery capability from solution design to operations. Successfully delivered over 50 private cloud projects for large and medium-sized enterprises.
- Strong automation operations capability, proficient in PowerShell/Shell scripting, familiar with Python fundamentals, skilled in using AI to develop Electron desktop tools, always seeking efficiency improvements through technology.
- Familiar with Docker container technology and Prometheus+Grafana monitoring system, with hands-on experience in containerized application deployment and monitoring configuration.
- Responsible and detail-oriented, with strong learning agility, excellent communication skills and customer service mindset. Thrives in high-pressure work environments.
